Cutting to the chase...

Presentation Overview

- Background why the need for the study
- Conceptual model
- Methods instrumentation and sampling
- Results and Discussion
- Conclusion

- The objective of this study was to show that *unsaturated* coal reject piles stored on an alluvial fan were not a selenium leaching risk at the Willow Creek Mine
- Permit condition to move CR piles placed between 2005 and 2006
- Basis for concern from prediction studies
 - Including lab and field based kinetic tests designed to maximize weathering rates

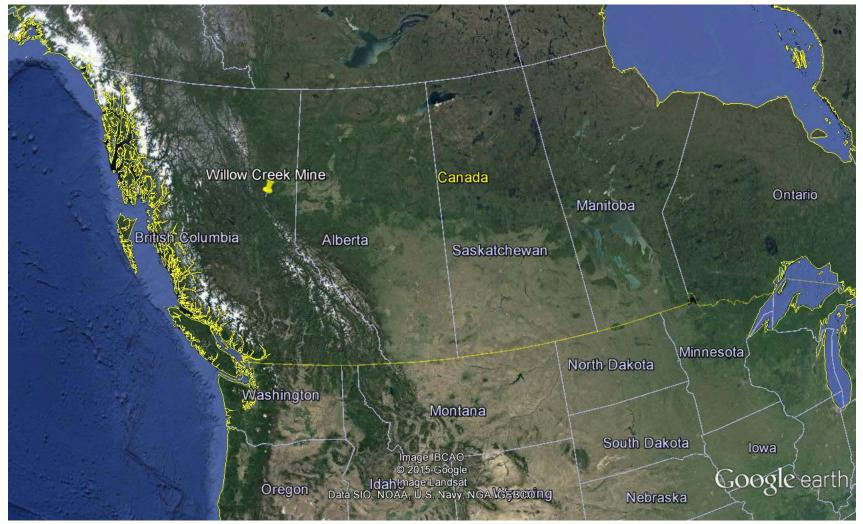

- The WCM is a metallurgical coal mine
- Located in the western Canadian rockies, north-east British Columbia
- Surrounding the coal seams are sandstones, shales, siltstones and mudstones
- CRs produced by density separation methods

 organic flotation reagents not used

Conceptual Model

10th ICARD IMWA2015 10% International Conference on Acid Rock Drainage

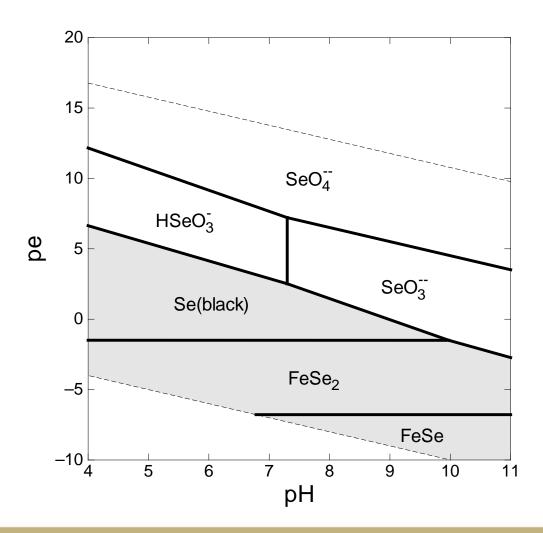

Conceptual Model

- Behaviour of selenium under neutral pH is dependent on redox
- Generally, the more reducing, the less soluble selenium becomes

Conceptual Model

10th ICARD IMWA2015 10"International Conference on Acid Rock Draining

 \bigcirc

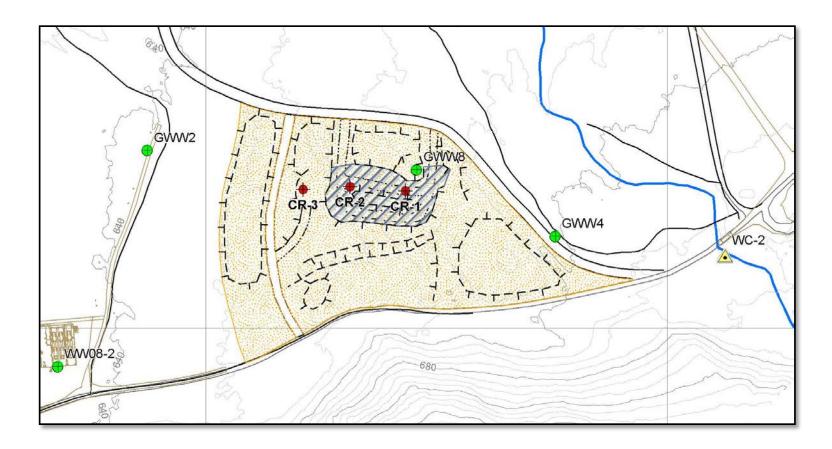

Methods

- Operational data (n = 69)
 - Composition, ABA
- Permit application (n = 44)
 - Composition, ABA, mineralogy, humidity cells, field barrel tests, and MWMP
- Instrumentation and sampling
 - CMTs to monitor gas and temperature
 - Aspectic grab samples for microbial community characterization (cultivation for presence/absence)

Instrumentation

10th ICARD IMWA2015 10th International Conference on Acid Rock Drainage

Instrumentation

GECAMIN

Results: Geochemistry

- Non-PAG material with relatively low sulfide sulfur (~0.16%)
- Selenium content approximately 2.6 mg/kg, which is consistent with other coal in BC, but high relative to typical sandstone (0.05 mg/kg) and shale (0.6 mg/kg).
- Selenium and sulphur correlated in solids
 r = 0.45; 99% confidence = 0.31
- Plus mineralogy, leach tests, previous experience indicate Se and SO₄ from same source

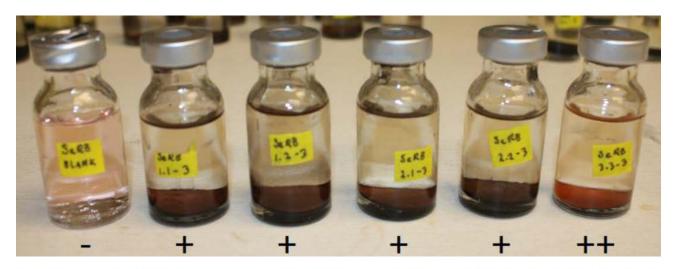

Results: Gas Composition & Temperature

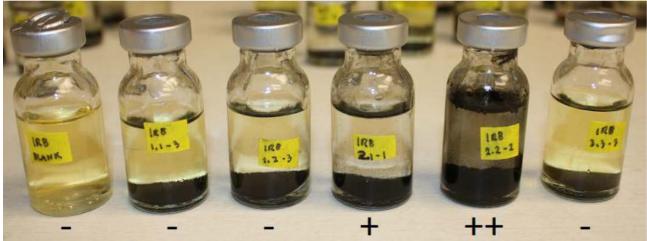

Results: Microbiology

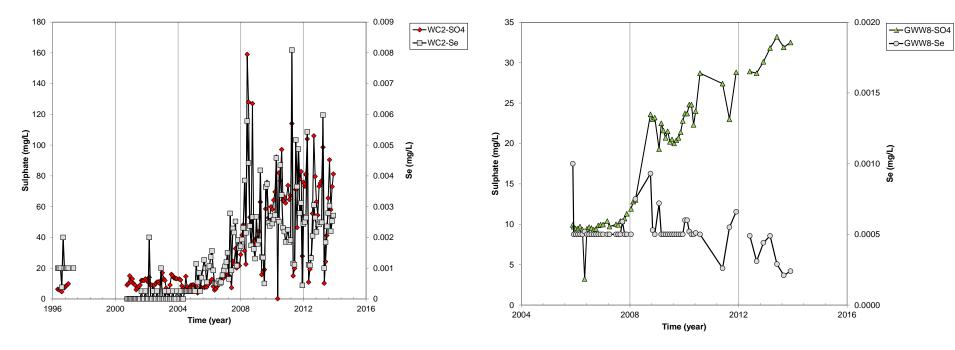

10th ICARD IMWA2015 10 INVA ANNUAL CONFERENCE OF ACId Rock Drainage

GECAMIN

Back to the first slide....

- WC2 sulfate and selenium well correlated (r = 0.85; 99% confidence)
- GWW8 sulfate and selenium not correlated (r = -0.3)

Conclusions

- Conceptual model supported
- Sub-oxic zones in the unsaturated CR piles support microbial community capable of selenate reduction to more immobile forms
- Recommendation to leave the piles in place and *not* disturb established biogeochemical conditions
